

Dr B Townsend

Emergency Department

Newtown Children's Hospital

10-04-10

Dear Dr Townsend,

R: Emma Johnson, aged 11

Thank you for urgently seeing Emma, who has exacerbated asthma which triggered by viral URTI. Your urgent assessment would be highly appreciated.

Emma has presented at my practice today with complaint of deteriorated shortness of breath associated with wheezing over the past two days. Emma has showed symptoms of viral URTI with loss of appetite. On examination, inflamed throat and accessory muscles usage were noticed but no focal signs. Emma's PEFR has dropped to 140L/minute. Ventolin nebuliser had a minimal relief to her condition.

Over the past five months, Emma, who has a positive family history of asthma, has complained of multiple episodes of viral URTI which accompanied by nocturnal cough for which, paracetamol and fluids were commenced. She was diagnosed with asthma. Salbutamol and ventolin have failed to improve her symptoms; therefore, Becotide 200 2 puffs three times per day was prescribed and to continue using ventolin. Emma has showed a good prognosis, her exercise-induced asthma has improved and her PEFR has reached 340L/minute.

It would be appreciated if you could assess in Emma's condition. Should there be any queries, do not hesitate to contact me.

Yours sincerely,

Doctor
