Dear Dr Bradbury,
Re: Ms Isabel Garcia

I am writing to update you regarding your patient, Ms Garcia, after the diagnosis of bacterial meningitis was confirmed. I would appreciate your further help regarding chemoprophylaxis of her recent close contacts.

On 23/05/2015, Ms Garcia complained of painful and stiff joints of one week duration, photosensitivity, bruising, headache and rash. On examination, there was bruising of the left arm, petichial rash on the abdomen and legs, and she was not able to touch neck when lying supine. However, there was no fever. Her blood test result and lumbar puncture test result were consistent with bacterial meningitis. Therefore, she was immediately started on ceftriaxone two grams IV twice daily and first dose of dexamethasone long IV were given before the antibiotic.

Ms Garcia is responding well to the treatment and she has been started on benzylpenicillin 1.8 gm IV every 4 hours for 5 days after the lumbar puncture culture results. She will continue on dexamethasone long IV 6 hourly for 4 days. The Department of Human Services was notified and I counselled her family members regarding the importance of immunisation.

In view of the above I would be grateful if you could contact Ms Garcia's close family and
