Dear Dr McLaren,

Re: Mr Michael Weir, aged 44

Thank you for neurological assessment of Mr Weir for the possibility of multiple sclerosis.

Mr Weir who is a real estate agent, gives a history of heavy smoking, obesity and depression for which he takes Zoloft since 2012.

On 29/6/2014, Mr Weir presented complaining of tiredness. Examination revealed low BP and high BMT. CBC and Cholesterol were requested to be discussed with him after one week.

On 7/7/2014, Mr Weir exhibited left leg weakness along with general fatigue. Blood test showed hypercholesterolemia, anemia and low white blood cell count. Smoking

Cessation was advised. Improving diet and adopting exercise routine were suggesting for a review after one month.

Today, Mr Weir attended with tingling in both hands and left leg weakness. He also mentioned having two recent blackouts of 2 minutes duration along with dizziness. On Examination, Sensation in both hands was lost in addition to loss of left leg patellar reflex. Thus, multiple sclerosis was suspected. Consequently CT and MRI were ordered to investigate the possible causes (spinal cysts, tumours, ...) and results will be sent to you.

In view of the above, I provisionally diagnosed Mr Weir with multiple sclerosis but I need further confirmation from your side. I would be grateful for your full neurological assessment and management of his condition. For any questions, please contact me.

Yours Sincerely

Doctor
